

## Note 1. Set Theory and Functions

**Definition 0.1** A set is a collection of objects that can be written in any order.

**Example:**

$$A = \{1, 2, 3, 4, 5\}.$$

$$B = \{2, 1, 5, 4, 3\}.$$

$$C = \{x \mid x \text{ is an integer and } 1 \leq x \leq 5\},$$

or

$$C = \{x : x \text{ is an integer and } 1 \leq x \leq 5\}.$$

We have

$$A = B = C.$$

Notation:

- If  $x$  is an element of a set  $S$ , we write  $x \in S$ .
- If not,  $x \notin S$ .
- The empty set  $\{\} = \emptyset$  has no elements.
- The **cardinality** (or the **size**) of  $S$ , written  $|S|$ , is the number of elements in  $S$ .

**Definition 0.2** A set  $B$  is a subset of a set  $A$ ,  $B \subseteq A$ , if  $x \in A$  for each  $x \in B$ .

Notation:

- $B \subseteq A$  :  $B$  is a subset of  $A$ .
- $B \subset A$  :  $B$  is a proper subset of  $A$ , which means  $B \neq A$ .
- $B \not\subseteq A$  :  $B$  is not a subset of  $A$ .
- $A \supseteq B$  :  $B$  is a subset of  $A$ , or  $A$  contains  $B$  as a subset.

**Definition 0.3** A relation  $R$  on sets  $X$  and  $Y$  is a set of ordered pairs  $(x, y)$  where  $x \in X$  and  $y \in Y$ .

Properties of Relations:

- A relation  $R$  is called **reflexive** on a set  $S$  if for all  $x \in S$ ,  $(x, x) \in R$ .
- A relation  $R$  is called **irreflexive** on a set  $S$  if for all  $x \in S$ ,  $(x, x) \notin R$ .
- A relation  $R$  is **symmetric** on a set  $S$  if for all  $x \in S$  and for all  $y \in S$ , if  $(x, y) \in R$  then  $(y, x) \in R$ .
- A relation  $R$  is **antisymmetric** on a set  $S$  if for all  $x \in S$  and for all  $y \in S$ , if  $(x, y) \in R$  and  $(y, x) \in R$ , then  $x = y$ .
- A relation  $R$  is **transitive** on a set  $S$  if for all  $x, y, z \in S$ , if  $(x, y) \in R$  and  $(y, z) \in R$ , then  $(x, z) \in R$ .

**Definition 0.4** The Cartesian Product  $X \times Y$  of sets  $X$  and  $Y$  is the relation consisting of all ordered pairs  $(x, y)$ .

$$X \times Y = \{(x, y) \mid x \in X \text{ and } y \in Y\}.$$

Note that every relation  $R$  on  $X$  and  $Y$  has  $R \subseteq X \times Y$ .

**Example:**

Let  $A = \{2, 3, 4\}$  and  $B = \{4, 5\}$ . Find  $A \times B$ ,  $B \times A$ ,  $B^2 = B \times B$ , And the sizes of them.

$$A \times B = \{(2, 4), (2, 5), (3, 4), (3, 5), (4, 4), (4, 5)\}.$$

$$B \times A = \{(4, 2), (5, 2), (4, 3), (5, 3), (4, 4), (5, 4), \}$$

$$B^2 = B \times B = \{(4, 4), (4, 5), (5, 4), (5, 5)\}.$$

$$|A \times B| = |A| \times |B| = |B \times A|.$$

**Definition 0.5** A relation  $f$  from  $X$  to  $Y$  is a function if each element of  $X$  appears in exactly one ordered pair of  $f$ .

- The domain of  $f$  is  $X$ ,
- The codomain of  $f$  is  $Y$ ,
- The range of  $f$  is the subset of  $Y$  containing the elements of  $Y$  that appear in ordered pairs of  $f$ .
- If  $(x, y) \in f$ , we say that  $f$  maps  $x$  to  $y$ .

Properties:

- A function  $f : X \rightarrow Y$  is **injective** (or one-to-one) if each element of the range appears in exactly one ordered pair of  $f$ .
- A function  $f : X \rightarrow Y$  is **surjective** (or onto) if the codomain and range are equal.
- $f$  is **bijective** if it's one-to-one and onto.
